

How to start using WireQueue

To get up and running you will need to:

- create a new server that only you can access. It has to have a unique Server Name
- create an Admin login/Admin password so that you can administer your server
- create a *Username/Password*. Only clients that know these credentials are allowed to connect to the server.

Clients can be of many different types, e.g.:

- a PC running LabVIEW
- a cRIO running LabVIEW RT
- a smartphone running Android
- a tablet running iOS
- an ordinary Web browser

Below are the steps you need to go through to get this working:

- Goto <u>www.wirequeue.com</u> and request an Administrator Account.
 You have to fill in what you want the *Server Name* to be.
 You will then get a mail containing an *Admin login* and *Admin Password* for this server.
- 2. Use the credentials from step 1 to log in to the Administration Web Page at <u>www.wirequeue.com</u>.
- 3. Note the parameters printed to the left of the page under WireQueue Server Info header. You will need them to use the LabVIEW driver or log into the Apps.
- 4. Scroll down to create a new WireQueue user; fill in Username and Password and press CREATE USER.
- 5. You can now start using WireQueue!

Guide AC0078-001, rev A

1.1 Using the LabVIEW driver

To use the LabVIEW driver you must fill in the following parameters into the Init.vi or on the front panel of one of the provided examples:

- Server Instance
- Server port
- Username
- Password
- ClientID

You can use the same credentials anywhere. The only thing that has to be unique for every device on your server is its *ClientID*. In the LabVIEW examples *ClientID* is already filled in, but when you write your own code you must choose a value you feel is relevant, just keep it unique on your server.

1.2 Using the Mobile Apps

You use the same credentials when logging in to a Mobile App:

- Username
- Password
- Server instance
- Server port

However, you can't set the *ClientID*. It is always set to the same value as the *Username*.

1.3 Using the Web Client

The Web Client can be found at <u>www.wirequeue.com/webclient/</u> When logging in to a Web Client the parameters are slightly different:

- Username
- Password
- Server name

Here also *ClientID* = *Username*.

If another device connects to your server with a *ClientID* that is already in use, the other device that uses the same *ClientID* will be kicked off the server.

To avoid these conflicts and make it possible to use more than one mobile or web client simultaneously, you simply have to create Usernames/Passwords on the Admin web page.
